Trauma Informed Care: Humanizing Past Medicine

Lauren McGrath, Princeton University, laurennm@princeton.edu

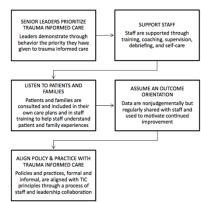

Critical Background

- Trauma informed care is an evolved form of healthcare which is implemented to those with emotional trauma in response to psychiatric care facilities; it boasts to lower re-traumatization with "discrete interventions" and "non-coercive staffclient interactions," emphasizes the reduction of physical coercion (Bryson).
- This concept is often medically framed in psychiatric care and in early childhood
- A humanities approach allows for the center of attention to be on the patients and their lives, instead of the practical logistics of healthcare strategies; emphasized the reduction of physical coercion (Bryson).

Research Ouestions

- What is so beneficial of trauma informed care and what does it offer that other forms of care do not?
- How does the training involved in trauma informed care humanize medicine?

Theory of Trauma Informed Care

Bryson, page 13.

Field Site- UIH Family Partners

- "What happened to you."
- Using discussion as a safe zone to relinquish secrets and personal experiences to gain insight
- Discussing personal emotional withdraw and why it has the most profound and long lasting effect
- Concept of "hurt people hurt others"
- Giving your child different experiences or your experiences?
- Government agencies think that medication is the answer while it, "hides the issues."
- Core values: learning and growing from each other in a positive and structured environment
- The trauma umbrella: complex variations of trauma

Insights and Discussion

- Research showed that development of trauma informed care resulted from a branching away from restrictive and forceful psychiatric care
- Described that traditional psychiatric care can retraumatize individuals; trauma informed care was created to eliminate that possibility
- Relation of structural violence created by parent absence and culture- will it continue or can trauma informed care eliminate this aspect?
- Could result in a decrease in childhood medication if trauma informed care is widespread
- Unanswered questions and possible future research: administration of trauma informed care by region; is trauma informed care used for differing problems/symptoms by region?

Curated by the Students of ANT/HUM 235 | Medical Humanities Instructors: João Biehl & Amy Krauss Teaching Fellows: Arbel Griner & Serena Stein

Acknowledgments

Much thanks to Professor Biehl, Professor Krauss, Serena Stein, Arbel Griner, Patty Lieb, Leah Anderson, Carter Patterson, and UIH for all their support and help in this process.
